## Effective Programming Practices for Economists

## Version Control and collaboration with

## Git and Github

## Pre-commit hooks

Janoś Gabler and Hans-Martin von Gaudecker

## What are pre-commit hooks

- We saw the importance of following style guides
- Pre-commit hooks are tools to help you automate style guides
- Examples of pre-commit hooks are:
- The black formatter that automatically formats your code
- The ruff linter that tells you about problems and fixes some of them
- Line-ending fixers for better compatibility across platforms
- Save a lot of time but have a learning curve

## Activating pre-commit hooks

- Install the 'pre_commit python package
- conda install pre_commit
- Open a terminal in the root of your repository
- Execute pre-commit install

Just needs to be done once after cloning the repository

## Configuring pre-commit hooks

repos

- repo: https://github.com/psf/black rev: 23.9.1
hooks:
- id: black
language_version: python3.11
- Pre-commit hooks are configured in pre-commit-config.yaml
- Typically inherited from the project templates or copy it from another project
- Example shows just the black formatter

## A useful git command

- 'git commit -am "Your message." stages and commits all modified files
- Does not work for untracked files
- Important because pre-commit hooks run over staged files!

## A badly formatted python file

```
def clean_data(raw):
    df = pd.DataFrame(index=raw.index)
    df["coding_genius"]=clean_agreement_scale(raw['Q001'])
    df['learned_a_lot']=clean_agreement_scale(
        raw['Q002'])
    df['favorite_language'] = clean_favorite_language(raw['Q003'])
    return df
def clean_agreement_scale(sr):
    sr = sr.replace({'-77': pd.NA,'-99':pd.NA})
    categories = ['strongly disagree',
        disagree',
    neutral', 'agree',
            'strongly agree'
    dtype = pd.CategoricalDtype(categories=categories,
    ordered=True)
    return sr.astype(dtype)
```

## Git status

example on 即main [+] via \& v3.11.0 via C epp_topics > git status
On branch main
Changes to be committed:
(use "git restore --staged <file>..." to unstage) new file: example.py
example on 卿main [+] via \{ v3.11.0 via C epp_topics > $\square$

## First commit fails

example on 即main [+] via \& v3.11.0 via Cepp_topics
) git commit -am "Add example.py.
black.

- hook id: black
- files were modified by this hook
reformatted example.py
All done! ${ }^{+\dagger}+{ }^{++}$
1 file reformatted.

## Second commit works

example on 即main［＋］via \＆v3．11．0 via C epp＿topics
）git commit－am＂Add example．py．
black．
－hook id：black
files were modified by this hook
reformatted example．py
All done！$+{ }^{+}+t^{+}$
1 file reformatted．
example on 䳭main［！＋］via 2 v3．11．0 via C epp＿topics
＞git commit－am＂Add example．py．
black．
［main 4ee06b0］Add example．py．
1 file changed， 20 insertions（＋）
